Opioids: Prescription Drugs & Heroin

www.525foundation.org

What are opioids? Pain Medications or "narcotics" that work in the receptors of the brain.

Commonly prescribed opioids include:

Percocet
Oxycodone
Vicodin
Codeine
Morphine

Chemically, your brain does not know the difference between prescription opioids & heroin

People switch from prescription opioids to heroin because it's cheaper & easier to get

- Pinned pupils
- Dropped, smooth eyelids
- Sedated nodding movements
- Slack muscle tone
- Cool, clammy skin
- Low concentration
- Dry, cotton mouth
- Face and arm stretching, itching
- "Dreamy" walk or talk
- Slow reaction and movement

Signs of opioid Misuse or abuse:

Naloxone or "Narcan" is a nasal spray that can reverse an opioid overdose & save a life. You can get Narcan at most pharmacies without a prescription.

- Narcan only reverses the effects of opioids
- Narcan is a temporary solution (30-90 minutes)
- Narcan is safe & has no potential for abuse

Signs Of An Overdose Include

- slow, shallow, or no breathing
- unconscious or non-responsive
- pale, grey, blue skin
- snorting or gurgling sounds
- foaming at the mouth
- vomiting

RESPOND:

1. Call 911
2. Perform Rescue Breaths
3. Administer Narcan
